As smartphones and tablets continue to play an increasingly important role in the daily lives of many people, it is becoming more and more common for people to share their devices with other people. This is often done for convenience, because people want to be able to access their files and contacts from many different devices, but the real reason is usually simply to share files to friends and family. This is usually done through an online storage service, and you can easily access files you have stored there from a PC, Mac, tablet, or mobile device. What makes it especially convenient is that you can store many of your files in the cloud and get them back on any other device you're using. The problem comes in the form of security, though. For this reason, it is important to share your passwords with only people you trust, but there is no way to make sure this will always happen, no matter how careful you are. For many people, it's hard to share their passwords with trusted friends, and this is where an online password manager can help. Online password managers are services you use to store your passwords. With this, you can access your accounts in any device and from any location. An online password manager will also let you store
